Il Consumo di suolo

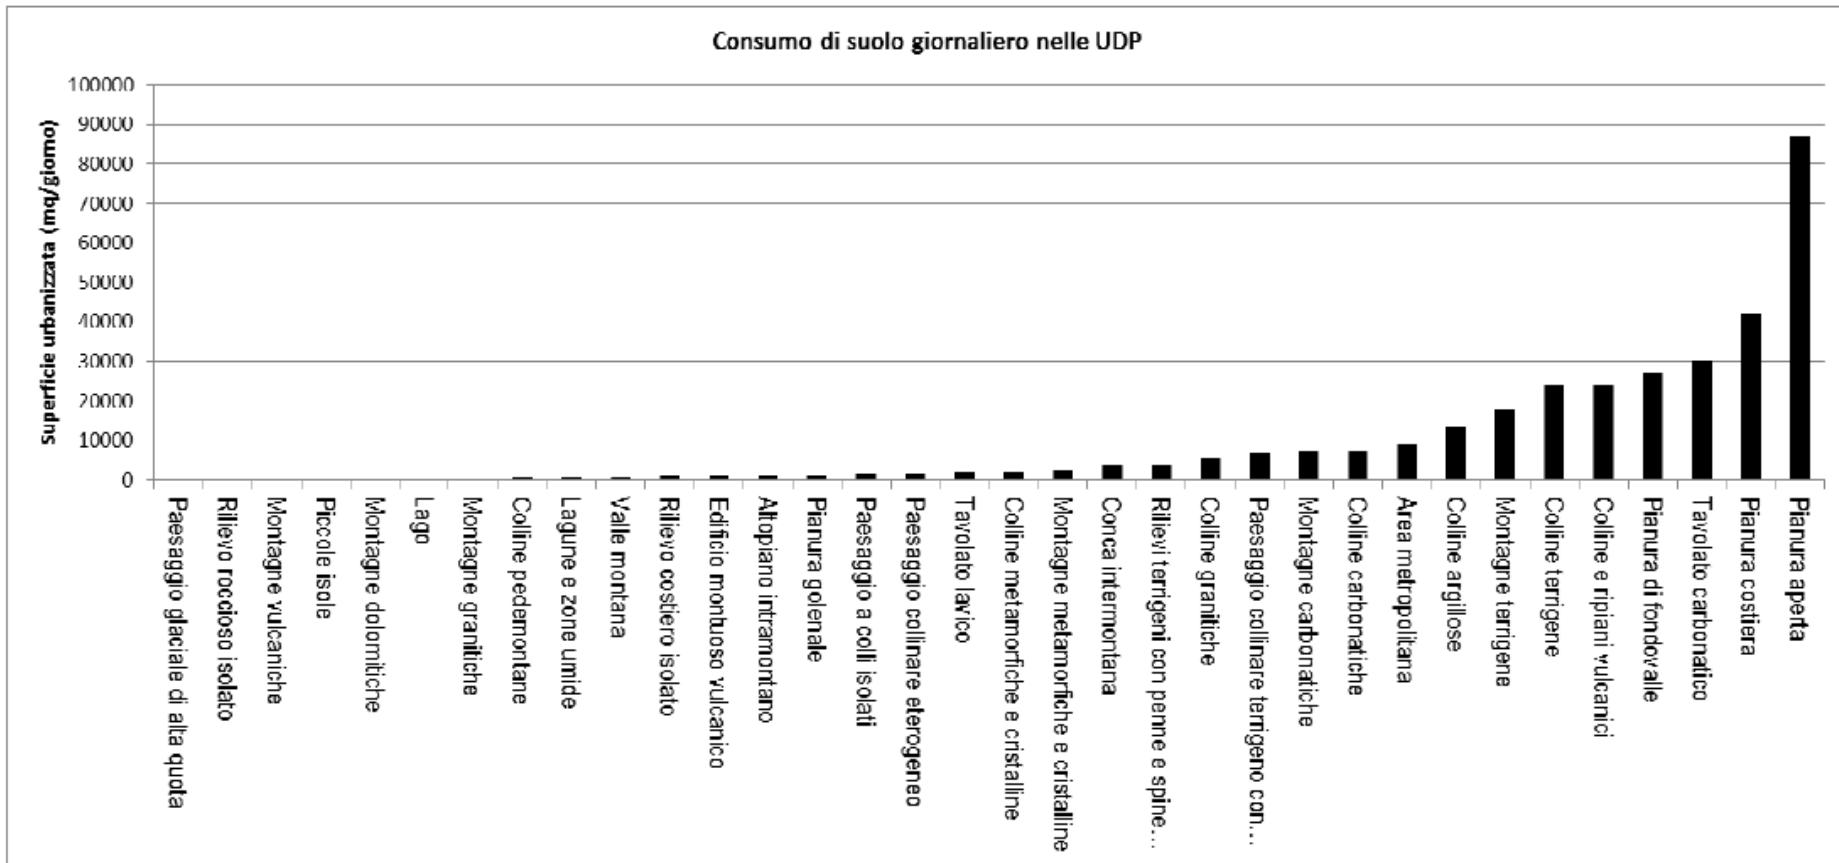

Consumo di suolo nei principali comuni italiani

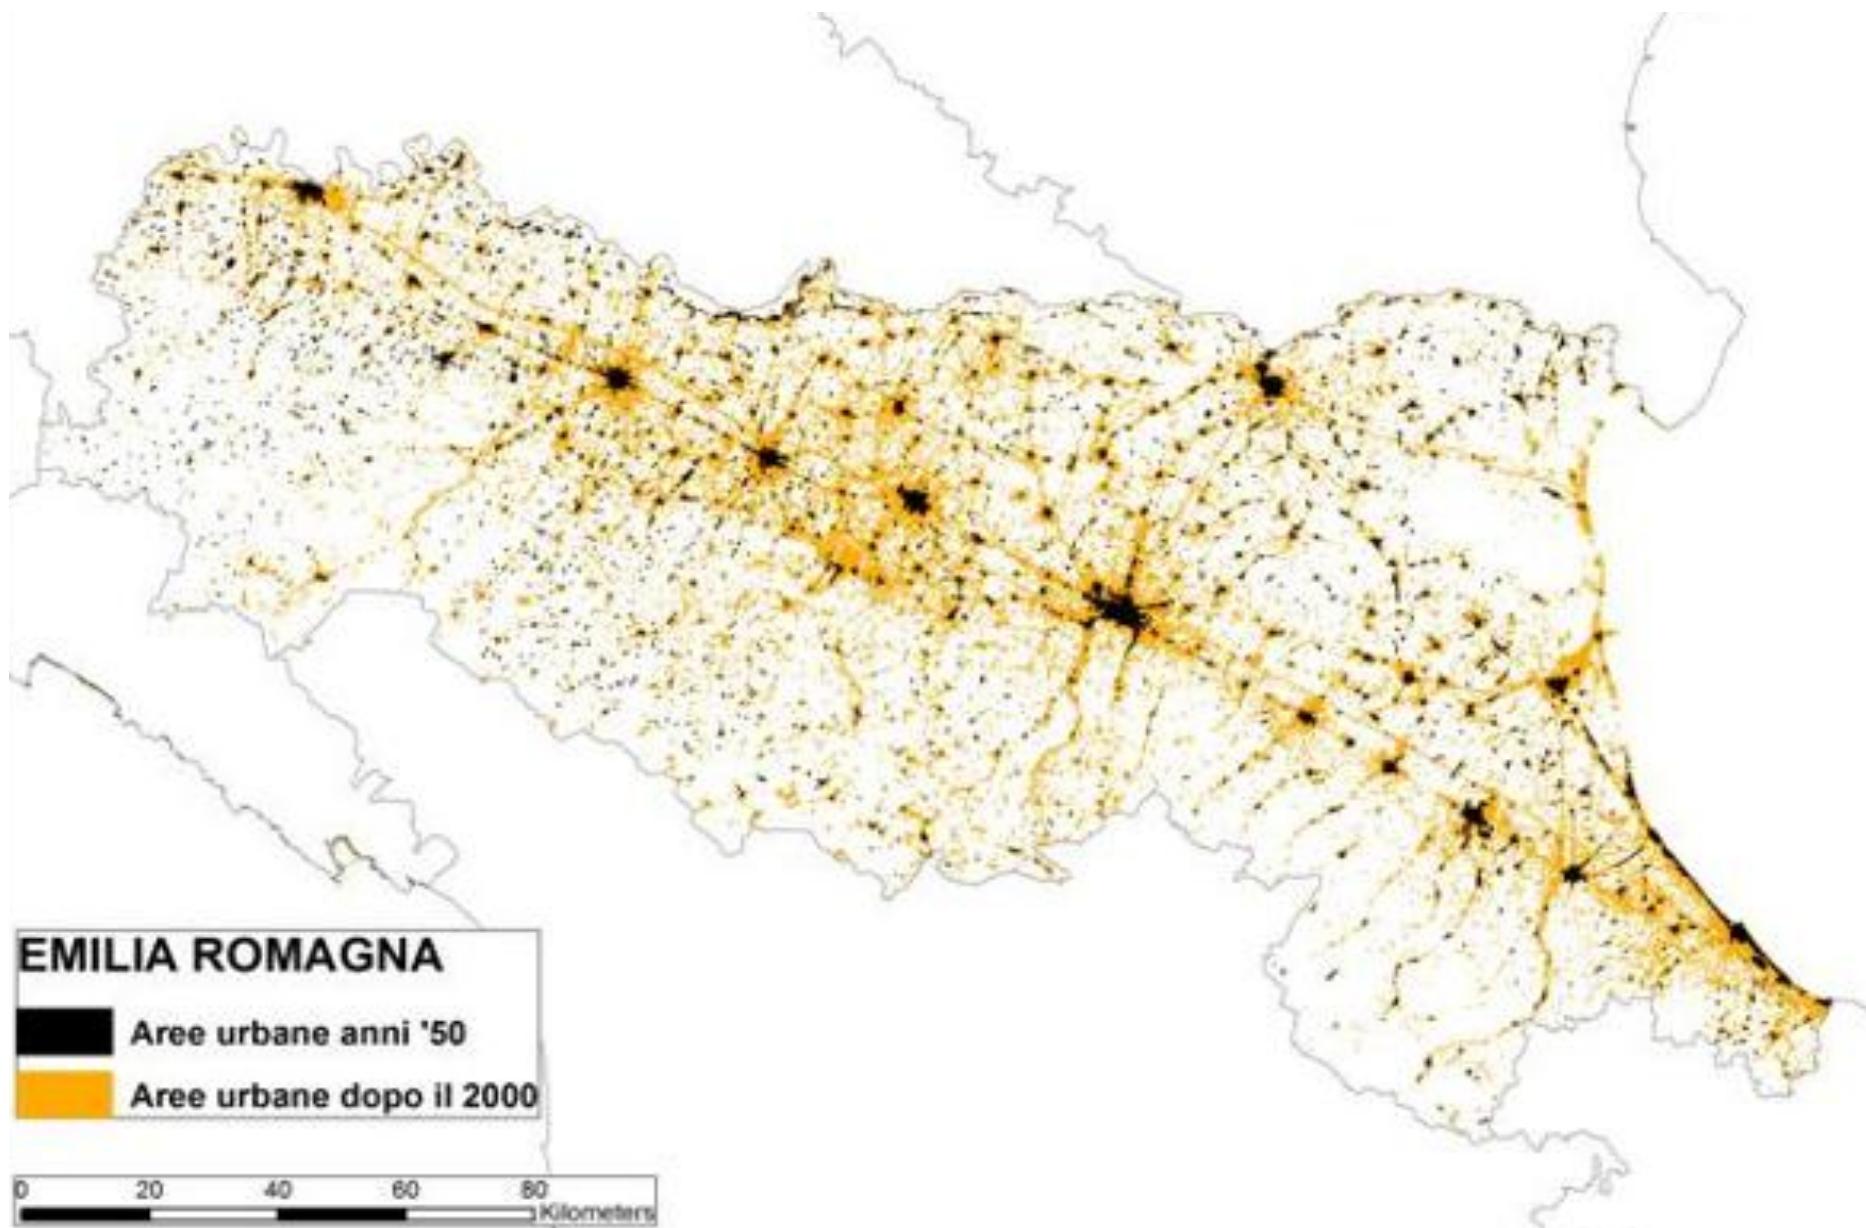

Superfici artificiali nelle regioni italiane, (Bianchi, Zanchini, 2011)

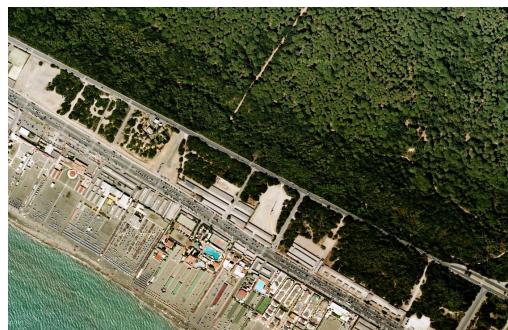

Consumo di suolo per unità di paesaggio(da Fai, WWF, 2012)

Ciome cresce la città

Il problema definitorio

- # Nel 1979 l'OECD (1979) definiva zone periurbane quelle comprese in un raggio di 20 km intorno ai nuclei urbani superiori ai 200.000 abitanti, 15 km per nuclei tra i 100.000 e i 200.000 abitanti e 10 km per centri tra i 50.000 e i 100.000 abitanti.
- # Il Censis aggrega in insiemi metropolitani tutte le unità comunali adiacenti che superano i 200 abitanti per km² e i 350.000 abitanti. Seguendo tali elaborazioni (Censis, 2008) in Italia nelle grandi aree metropolitane, che coprono il 17% della superficie territoriale, vive all'incirca il 61% della popolazione.
- # In Europa le aree classificate come periurbane occupano la stessa quantità di superficie urbanizzata delle aree urbane ma la metà della densità di popolazione. Il periurbano cresce 3,7 volte più delle aree urbane (Piorr et. al. 2009)

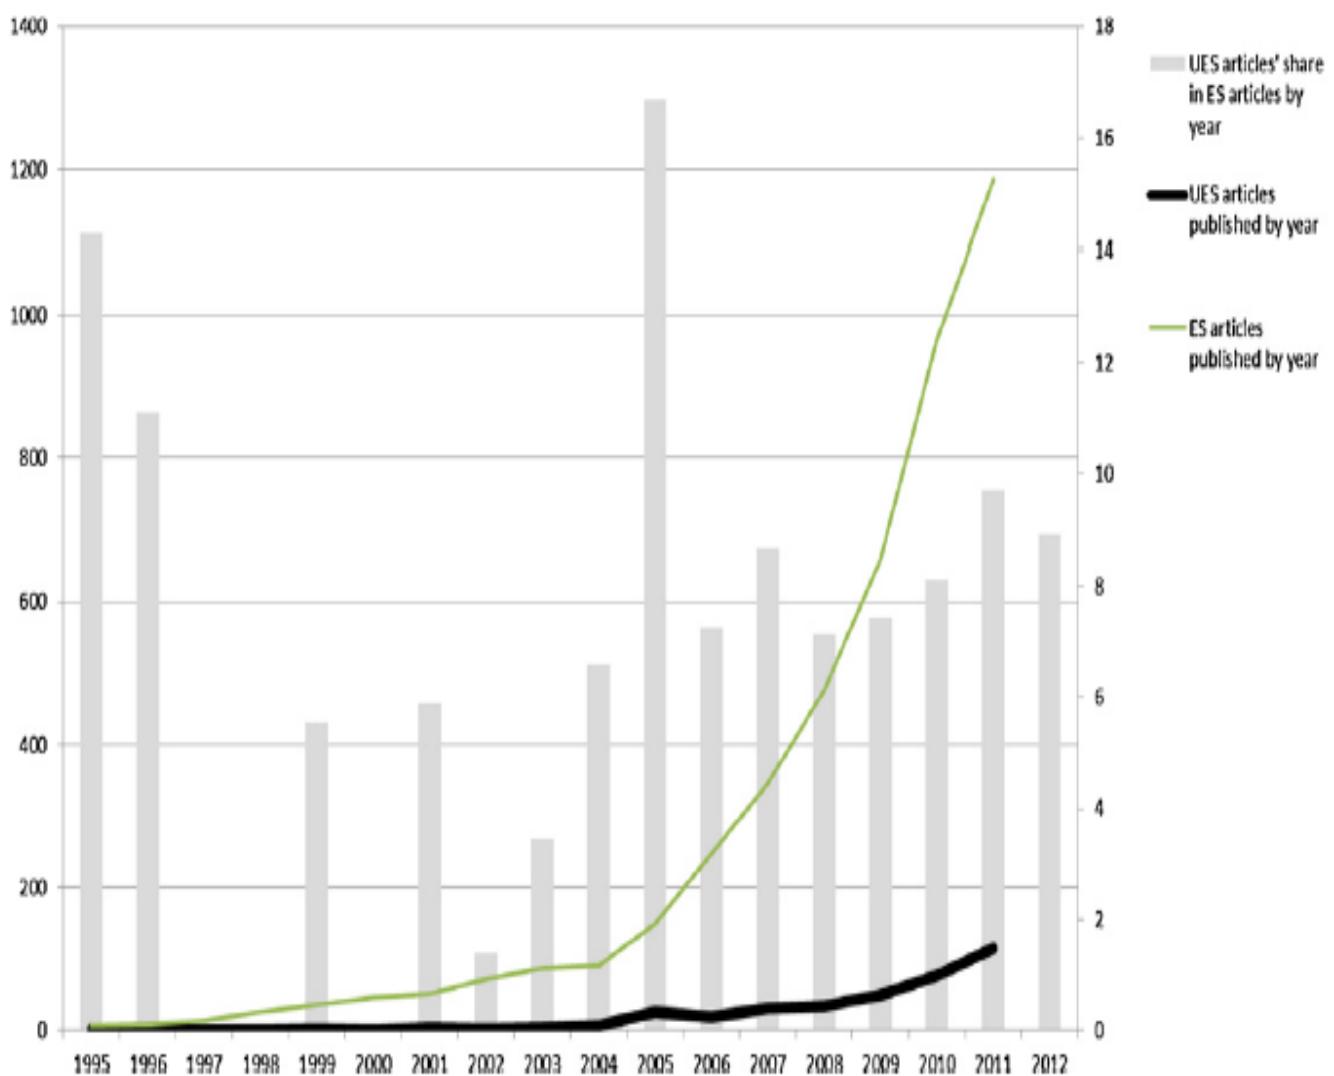

Fig. 2. Number of articles (left scale) referring to urban ecosystem services (UES) and percent share (right scale) of UES articles with respect to all of the ecosystem services (ES) articles published in a given year. Note: For 2012 there were 97 papers on UES and 1088 papers on ES as of October 8.

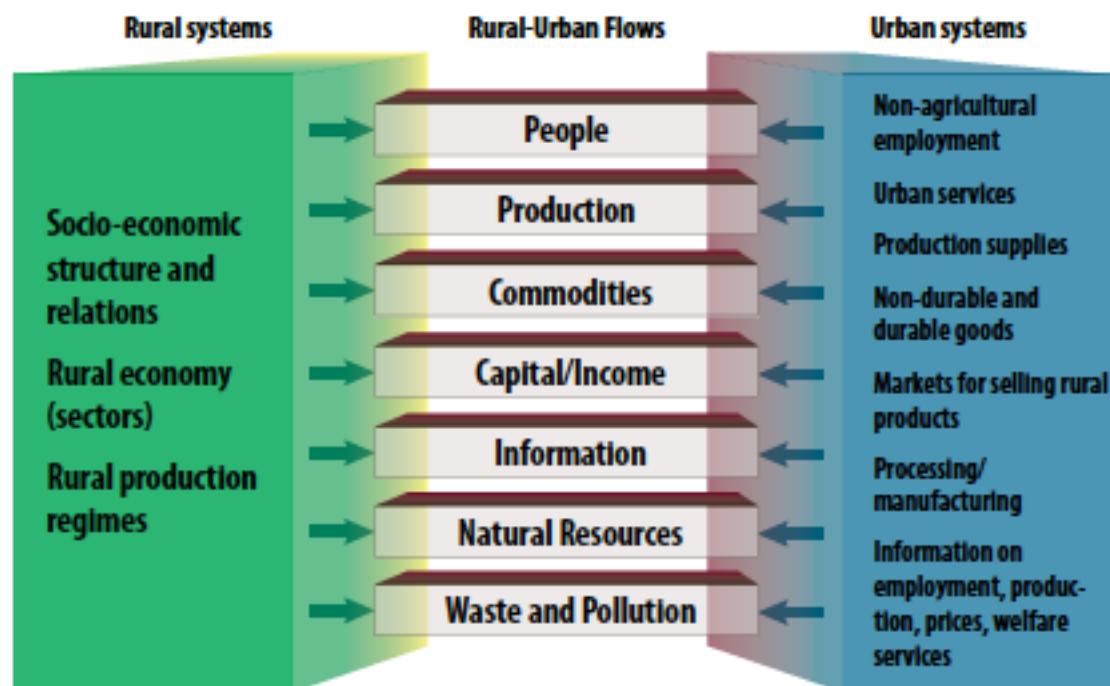

The TEEB Manual for Cities: Ecosystem Services in Urban Management

Why and how can a focus on ecosystem services help cities achieve their goals? This manual guides practitioners and decision makers in a stepwise approach towards counting on a city's natural capital - and making it work for you. The concept of 'ecosystem services' is key to this.

This manual builds upon the report TEEB – The Economics of Ecosystems and biodiversity for Local and Regional Policy Makers (2010) and draws on the combined expertise in sustainability management of participating local governments in ICLEI-Local Governments for Sustainability's Local Action for Biodiversity Programme, run in partnership with the International Union for Conservation of Nature (IUCN).

VALUABLE ECOSYSTEM SERVICES PROVIDED BY MANAGED LANDSCAPES IN URBAN AND SUBURBAN AREAS

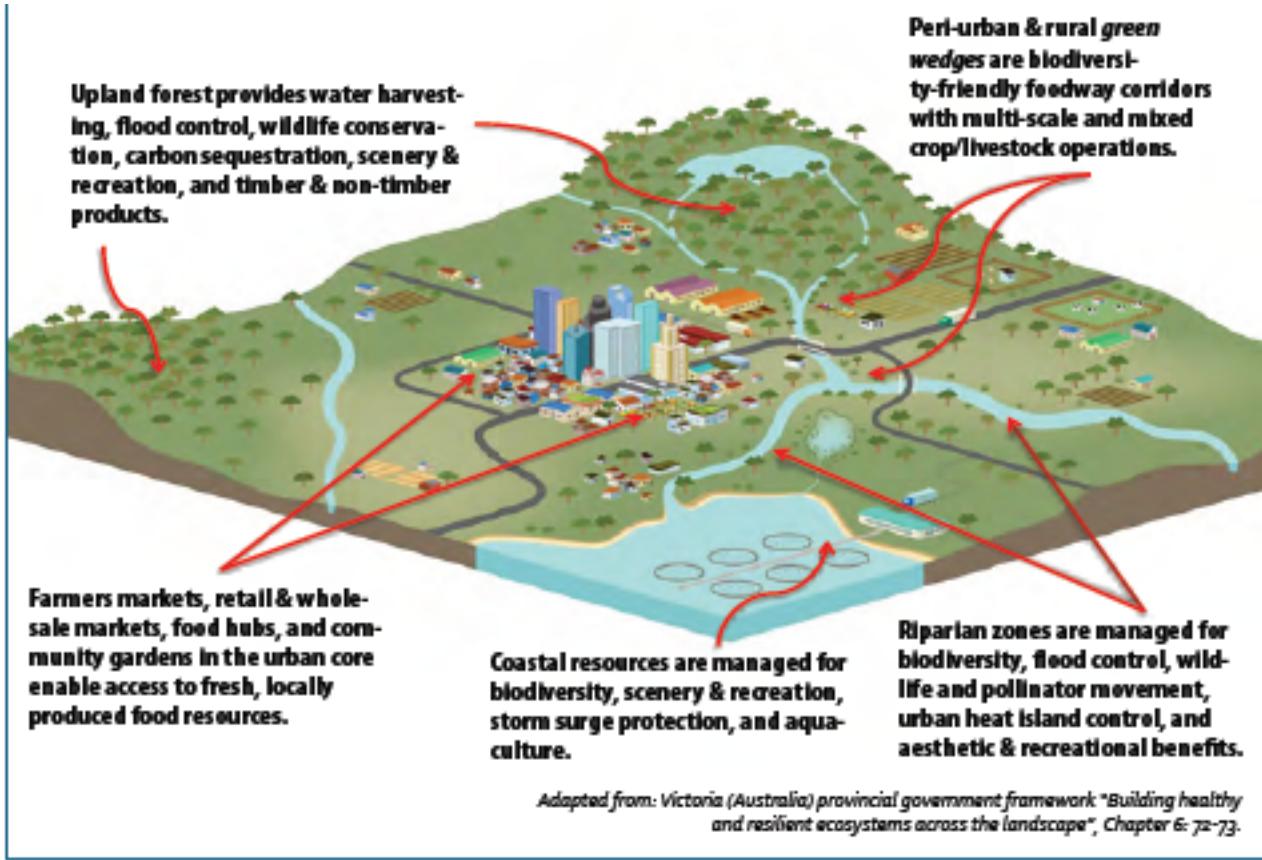

Service	Metric	Possible valuation measure	Value to landowner	Value to broader public
Aesthetic and recreation opportunities	Landscape quality rating by square footage	Added property value, measured in percentage increase of property value per additional square footage of turfgrass	x	
Water quality	Pounds of nutrients added or removed from water runoff per year	Avoided cost of implementing conventional water treatment infrastructure, measured in dollars per pound of nutrients removed		x
Air quality	Tons of particulate matter (PM) added or removed from the atmosphere per year	Added property value, measured in percentage increase of property value per household per ton of particulate matter (PM) removed from the air		x
Carbon sequestration	Tons of carbon dioxide sequestered or emitted per year	Market value of carbon, measured in dollars per ton sequestered in a carbon market		x
Local climate control	Avoided kilowatt hours of air conditioning per year	Avoided electricity cost in air conditioning or heating per year, measured in kilowatt hours	x	x
Water retention	Gallons of water runoff stored or generated per year	Avoided costs of implementing bioretention practices, measured in dollars per gallon retained	x	x
Soil retention	Tons of soil conserved or released per year	Avoided cost of replacing topsoil, measured in dollars per cubic yard	x

Example	Principal ecosystem services	Municipal tasks and objectives benefitting from a focus on ecosystem services
<p>Durban, South Africa: Durban examined the role of open spaces, especially in terms of meeting the basic needs (e.g. water, firewood and food) of the poor, who did not have access to adequate infrastructure or municipal services. Thanks to an assessment of ecosystem services, it was possible to demonstrate that the city's open space system significantly improved their quality of life and enhanced their ability to meet their basic needs (TEEBcase by Boon 2010).</p>	 <p>Fresh water Extreme events Tourism Food Raw materials Recreation</p>	<p>An ecosystem service approach to planning was useful to:</p> <ul style="list-style-type: none"> • Prioritise areas for urban development. • Make decision makers aware of the importance of nature conservation, previously perceived as a luxury. • Motivate municipal leadership and local politicians to take a number of tough decisions to protect the environment.
<p>Miami, USA: The city has used the CITYgreen tool for systematically including 'green infrastructure' such as parks, urban forests and wetlands into urban planning. This is mainly for the purpose of storm water protection, enhancement of air- and water quality and climate regulation. As a result a riverine area was rehabilitated which subsequently generated a range of positive side effects (e.g. recreational and property values) (TEEBcase by Förster 2010).</p>	 <p>Local climate Extreme events Soil erosion and fertility</p>	<p>A focus on the benefits of green infrastructure can:</p> <ul style="list-style-type: none"> • Support the effectiveness and efficiency of city efforts to regulate floods. • Help the city to ensure the quality of air and water. • Highlight the positive impact on property values.
<p>Vientiane, Lao People's Democratic Republic: Frequent heavy rainfall results in overflowing drains and urban flooding at least 6 times annually, damaging buildings and infrastructure. Several wetlands, however, absorb a proportion of the floodwater, dramatically reducing damages. The value of the ecosystem services of the wetlands has been measured (using annual value of flood damages avoided), calculating the value of the wetlands to be just under US\$5 million per year (TEEBcase by Gerrard 2010).</p>	 <p>Extreme events</p>	<p>A focus on the value of wetlands demonstrates:</p> <ul style="list-style-type: none"> • The potential of natural retention areas for flood control. • The savings which can be achieved by the city (e.g. less damage to infrastructure). • The importance of incorporating an ecosystem service approach in spatial planning.
<p>Kampala, Uganda: At the outskirts of Uganda's capital the Nakivubo Swamps provide an important ecosystem service. The swamps treat and filter the biological waste water from much of the city. Ideas to drain the wetland in order to gain agricultural land were dropped when an assessment of this service showed that running a sewage treatment facility with the same capacity as the swamp would cost the city around 2 million US\$ annually (TEEBcase by Almack 2010).</p>	 <p>Waste-water treatment</p>	<p>An assessment of the value of the wetland means that:</p> <ul style="list-style-type: none"> • City planners and the sanitation department may benefit from detailed information. • City council can make informed decisions based on various cost estimates. • Informal land conversion of the wetland for agriculture can be judged in the light of sewage treatment capacity lost. • Direct investment to maintain the wetland can be identified as a cost-effective measure to ensure future purification benefits.

I Servizi Ecosistemici e il benessere umano

«[...] the benefits human populations derive, directly and indirectly, from ecosystem function» (Costanza et al., 1997)

«[...] the benefits that people obtain from ecosystems » (MA, 2005)

«[...] the direct and indirect contributions of ecosystems to human well-being» (TEEB, 2010)

15	SIC	ITA060006	Monte Sambughetti, Monte Campanito	Sicily	Mediterranean	31.9
16	SIC/ZPS	IT8050055	Monti Alburni	Campania	Mediterranean	253.7
17	SIC	IT8050025	Monte della Stella	Campania	Mediterranean	11.8
18	SIC	IT8050006	Balze di Teggiano	Campania	Mediterranean	12.0
19	SIC	IT9310014	Fagosa – Timpa dell’Orso	Calabria	Mediterranean	61.7
20	SIC	IT9310008	La Petrosa	Calabria	Mediterranean	3.5
21	ZPS	IT4090006	Versanti occidentali del Monte Carpegna, Torrente Messa, Poggio di Miratoio	Emilia-Romagna	Continental	21.4

Lista dei Servizi Ecosistemici usati nel progetto LIFE+MGN

Servizi di approvvigionamento	F1	Foraggio, pascolo
	F2	Specie cacciabili/pesci
	F3	Materie prime (legno, fibre, ecc.)
	F4	Funghi, frutti di bosco, piante commestibili
	F5	Piante medicinali
	F6	Risorse genetiche
	F7	Acqua potabile
Servizi di regolazione	R1	Sequestro del carbonio
	R2	Regolazione del clima
	R3	Regolazione delle acque
	R4	Purificazione dell'acqua
	R5	Protezione dall'erosione e dissesti geologici
	R6	Protezione dai dissesti idrologici
	R7	Impollinazione
	R8	Controllo biologico
	R9	Habitat per la biodiversità
Servizi culturali	C1	Valore estetico
	C2	Valore ricreativo (ecoturismo, attività all'aperto)
	C3	Ispirazione per cultura, arti, valori educativi e spirituali, senso d'identità

Definita a partire da: TEEB; IEEP; CICES; WRI; OECD; Bastian, 2013

Iter metodologico per l'individuazione dei SE per sito pilota

Selezione dei principali SE per sito pilota

Relazioni tra SE e benessere umano

ZPS IT2070402

Alto Garda Bresciano

Habitat prevalenti:

Foreste illiriche di *Fagus sylvatica* (91k0), Foreste di versanti, ghiaioni e valloni di *Tilio-Acerion* (9180) e Foreste di *Quercus ilex* e *Quercus rotundifolia* (9340)

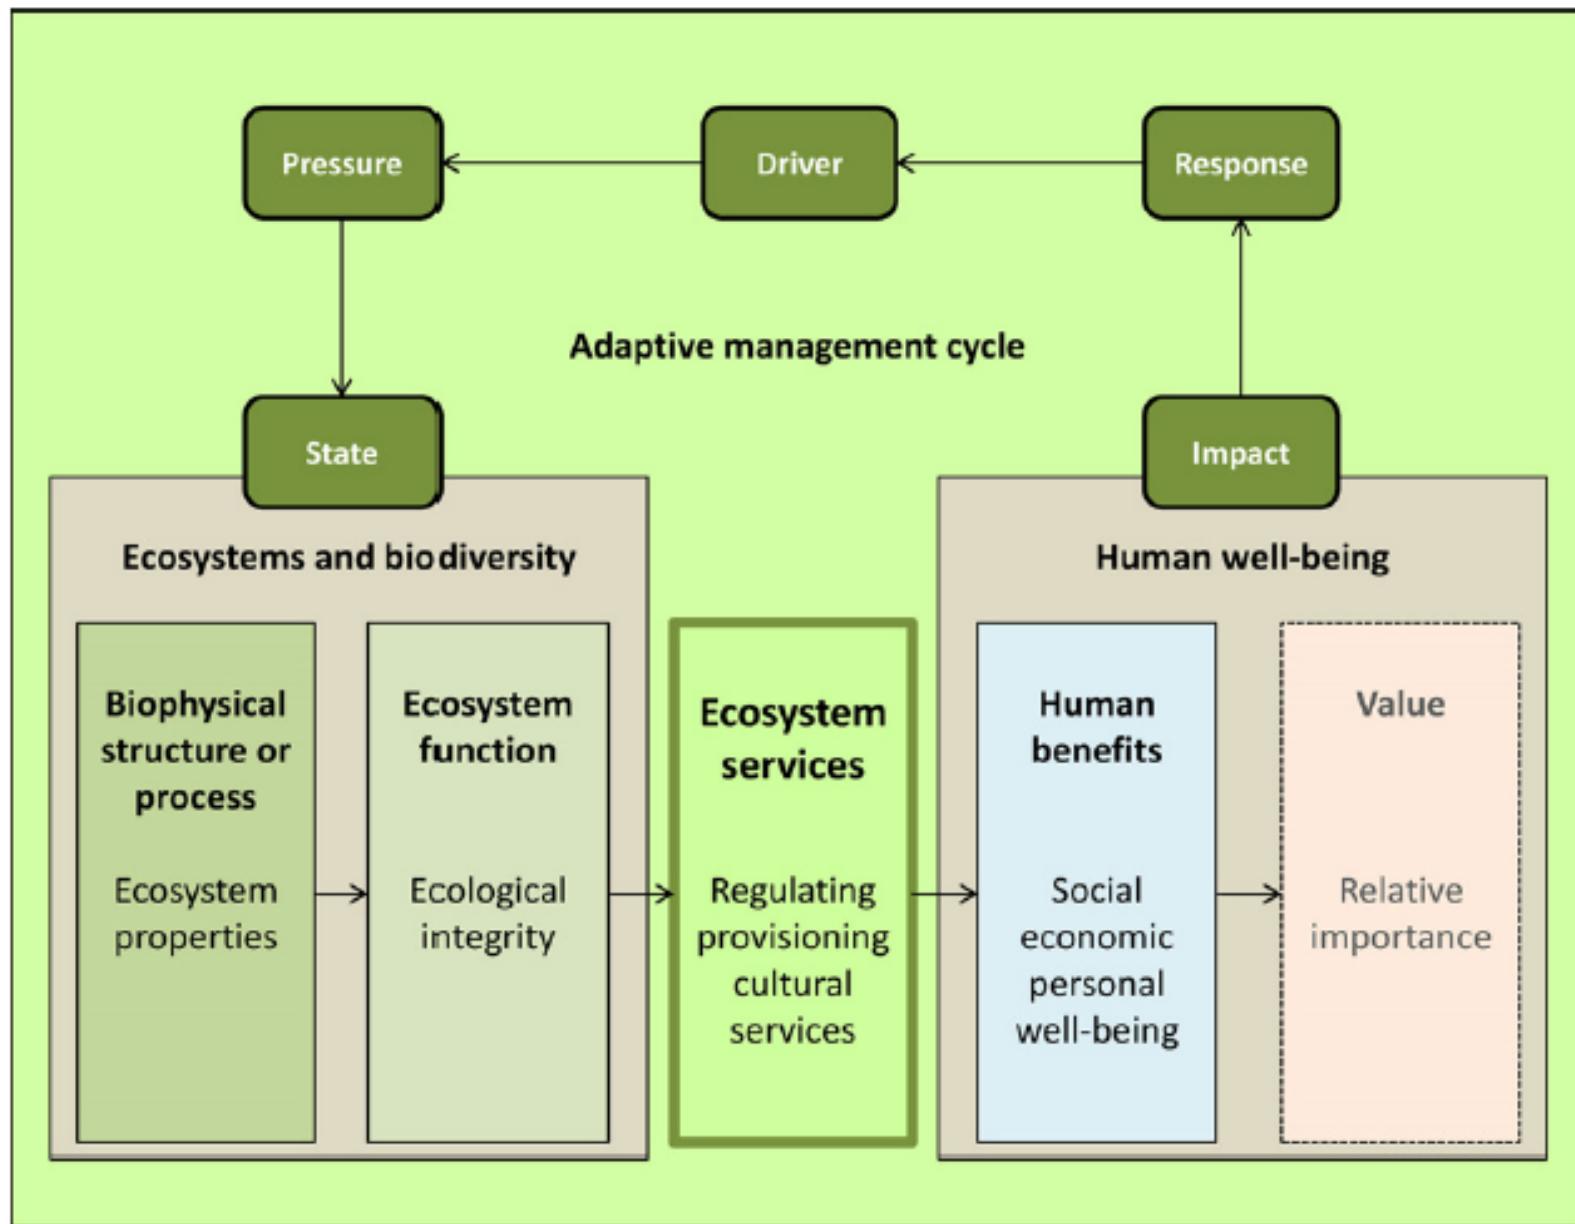

Servizio Ecosistemico esaminato:

Valore ricreativo (C2)

Indicatori benessere umano			Benessere economico					Benessere sociale					Benessere personale
			Reddito	Occupazione	Abitazione	Infrastruttura	Sicurezza	Alimentazione	Demografia	Salute	Educazione	Tempo libero	
BENEFICIARI	INTERNI	Operatori turistici	X										X
		Residenti	X									X	X
	ESTERNI	Turisti										X	X
		Operatori turistici	X										X
